

Combi-Switch

**Effective use of interactive whiteboards
in your training**

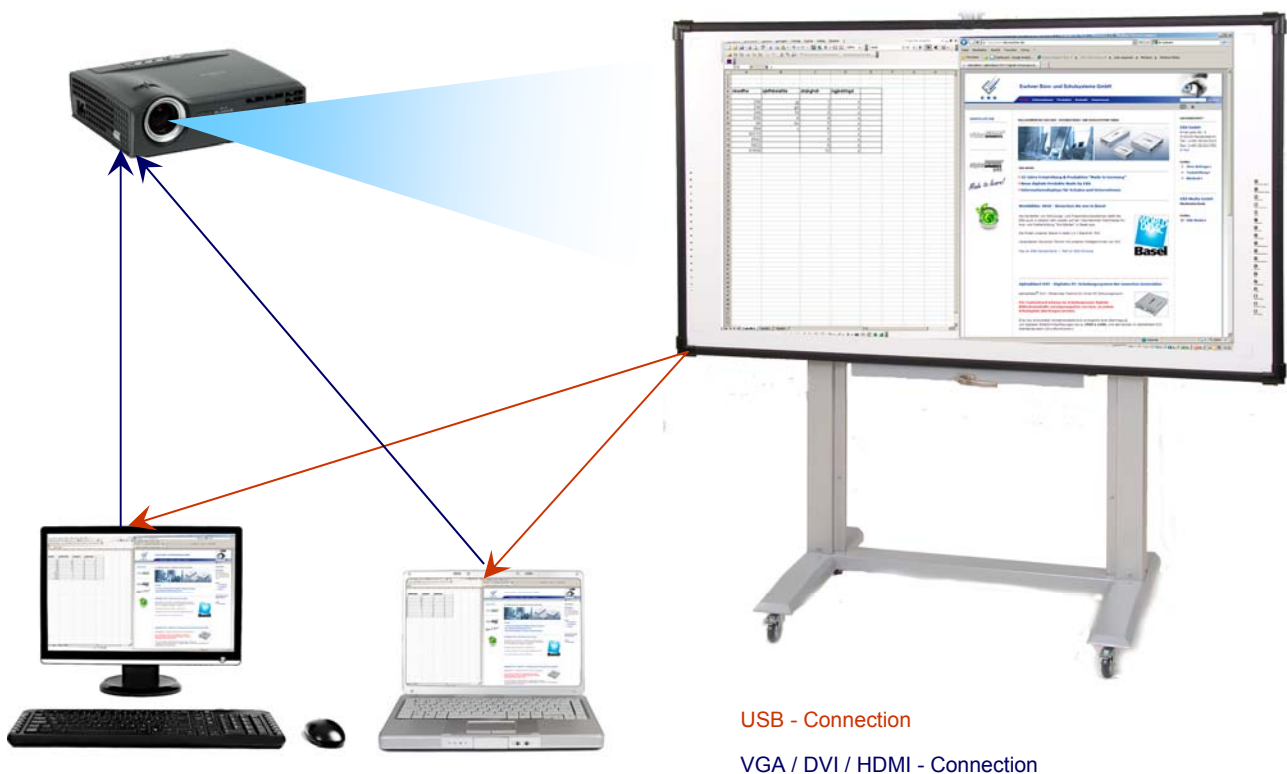

The unique combi-switch for interactive whiteboards

Within a standard IT-classroom the interactive whiteboard is directly connected to the instructor-PC. However, instructor's like to prepare their class on a notebook and then use the material accordingly.

The combi-switch enables the instructor to connect a PC and a notebook (via USB) to the interactive whiteboard and in addition to connect via VGA or DVI/HDMI to a projector as well.

The source is chosen over a small switch on the instructor PC. Due to amplification, screen signals can be transferred in best quality and highest resolution - even over long cable runs.

The interactive whiteboard can be used centrally, alternatively with PC or notebook.

The combi-switch was tested with all standard interactive whiteboard systems and projectors.
