

## **International school from Russia relies on multimedia systems Made in Germany**

**A new microscope training laboratory with the alphadidact digital multimedia system goes into operation at the Letovo International School in Moscow**

20th of October, 2020 - EBS Heusenstamm, Germany

With the equipment of its new microscope training laboratory, the Letovo International School in Moscow underlines its high quality standards in the training of its students.

„Our mission is to provide an enabling environment for bright and motivated students from every corner of Russia to receive a world-class education and achieve their intellectual and creative potential.“

In a national invitation to tender, Letovo International School chose the EBS partner BioLine as its supplier. In future, students will be trained on 17 Leica microscopes (including 1 lecturer + 16 students) with the support of the alphadidact digital multimedia system

from EBS Heusenstamm. EBS technology enables the digital microscope cameras to transmit signals to all monitors and to a large screen.

The live work of an individual student at the microscope is transmitted to all connected screens without delay and at the touch of a button.

Using the optional tablet control and the alphadidact app, all functions of the multimedia system can be carried out from any location in the training laboratory.

Interactive and lively training courses are only possible through the involvement of the individual training participants. Every workstation can be switched as a signal source and acting as a "presenter".

By installing EBS multimedia technology, students can be trained at each workstation at the same time.

Even in the back rows of the training laboratory, the participants can follow the training content in maximum quality and follow live preparations in detail.

The digital multimedia systems are developed by EBS in Germany and are already in use in numerous training rooms and laboratories around the world.
